## STRATEGIC SUPPLEMENTATION: MINERAL NUTRITION WITH A SELF FED LOOSE SALT-MINERAL MIX

---

**AUTHORS:** Mark Petersen, Shad Cox, Clay Mathis, Richard Waterman and Rachel Endecott

**THE STORY IN BRIEF:** Deciding on a dependable mineral program for a range cow herd can be confusing. Neighboring ranches and in fact pastures within a ranch may have important mineral composition differences. The Corona Range and Livestock Research Center has developed a mineral that complements the mineral deficiencies of the year long diet.

**THE PROBLEM:** Mineral nutrition can be complex. Consumption of mineral is the sum of vegetation, soil, water and supplement intake. Concentration of minerals in the diet and diet requirements fluctuates through the year. Designing a simple and easy to manage mineral program that succeeds may involve on the ranch testing for a couple of years. The form of All of these factors add to the challenges in formulating an effective mineral.

**OBJECTIVES:**

To develop a sensible low cost effective/simple mineral supplementation program for the cow herd at the Corona Range and Livestock Research Center.

**EXPECTED OUTCOMES:**

To maintain a sustainable mineral program that minimizes cost yet promotes animal health and productivity.

**DURATION:** 1992 to present (ongoing)

**APPROACH:** Vegetation diet samples have been collected with ruminally cannulated cows. The mineral content of their diet was compared to the requirements for cows, calves, yearlings and heifers. The difference was used to determine the amount of mineral needed in a self fed salt mineral mix. After a couple of years the cattle were biopsied at the liver to determine animal status. If the liver storage was determined to be adequate to meet production goals then the formula remained unchanged for that mineral. Daily intake per cow is continually monitored.?

**RESULTS:** To minimize the risk of imbalances, a yearlong mineral program should be a part of normal management. In New Mexico we know that phosphorus, potassium, magnesium, sodium, selenium and zinc are deficient in over 70% of the state's forages and copper is deficient in 40%. (Mathis et al. 2004) The foundation of a balanced range nutrition management plan is to supply needed minerals. We do this with a self-fed salt/mineral mix that is consumed at 60 g per day per cow averaged over an entire year. In addition, we will add mineral to cubes or blocked supplements. Once a mineral program is created and implemented then we must assess forage availability and quality..

On a yearly basis cow intake of our mineral is 1.8 ounces per head per day. (For example the average yearlong intake was 2004 mature cows was 1.91 oz/hd/d.) This is at least 90% of the targeted amount. This amount has been very consistent year after year even though there is extreme variation within a year. The results of our liver biopsies in cows and yearlings indicates that our mineral mix minimizes the loss of production that could occur do to the low concentration of minerals found in grazed forage diets (phosphorus, magnesium, copper, manganese and zinc). Example of our formula is listed below:

NEW MEXICO STATE UNIVERSITY  
CORONA RANGE AND LIVESTOCK RESEARCH CENTER  
MINERAL TO SUPPLEMENT RANGE CATTLE and SHEEP  
Desired consumption: 2 ounces per head per day cattle

Custom Formula

GUARANTEED COMPOSITION AND FORTIFICATION	concentration
<i>RangeMin – 05</i>	
Calcium, maximum	11.5 %
Phosphorus, minimum (1)	8 %
Magnesium, minimum	2 %
Potassium	2 %
Copper	2000 ppm
Zinc	1000 ppm
Manganese	2500 ppm
Selenium	13 ppm
Vitamin A, units/lb.	120,000

1. Amounts and kinds of phosphorus (excluding rock phosphate) may vary if phosphorus concentration is maintained. Calcium is not required.
2. Amounts and kinds of trace mineral may vary if minimums are maintained. Fortify with copper chloride and zinc sulfate or oxide (exclude copper oxide).
3. Fortify with ruminant trace mineral premix for 2 oz. consumption/hd/day.

### EXAMPLE FORMULA

Ingredient	Percent as is
White salt	38.7
Dicalcium phosphate	45.0
Wheat millrun	2.0
Potassium chloride	4.0
Magnesium oxide	6.6
Ruminant trace mineral premix	2.5
Copper sulfate	.4
Zinc oxide	.2
Manganese oxide	.3
Mineral oil, gallons per ton	6

**POTENTIAL APPLICATION:** Our mineral program costs less than \$7.50 per cow per year. On a year long basis intake is repeatable. The mix is not too palatable so over consumption is not a problem.

**EDUCATIONAL PLAN:**

1. Cooperating with Dr Mathis in preparing an Extension publication on mineral nutrition in the state.
