Set the desired GPS accuracy with the slider, and click "Done" to return to the main view.

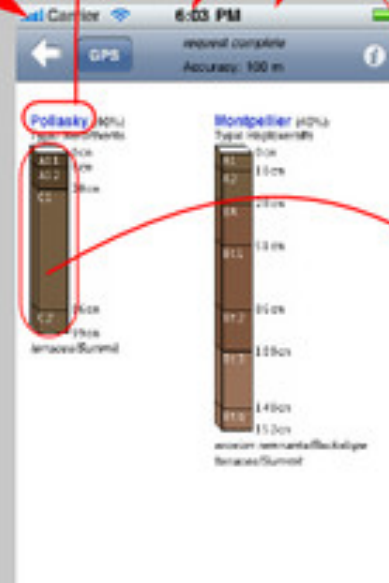

SoilWeb for iPhone

Click to start application

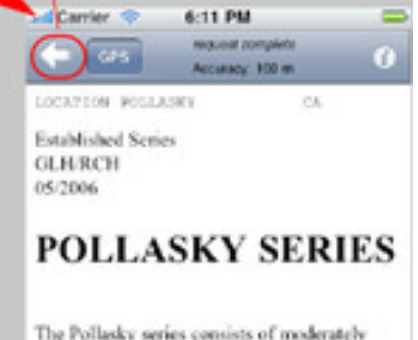

Application starts with GPS disabled. Click "GPS" to start acquiring location data. Click on the "info" button for application details.

Once a location with sufficient accuracy is acquired, map unit components are displayed. Soil profiles link to their Official Series Description

Component names are linked to their details on the CA Soil Resource page. Use the "back" arrow to return to the main view.

The Pollasky series consists of moderately deep, well drained, moderately coarse textured Regosols formed in the residua from soft to moderately consolidated arkosic sediments. They occur on undulating to steep dissected terraces under annual grasses and forbs. They have brown, slightly acid sandy loam A horizons and pale brown to yellowish brown, slightly acid to neutral, sandy loam C horizons abruptly overlying consolidated granitic sediments. Pollasky soils occur in the same
